

LE VAN KHOA レヴァン コア (チョーライ病院脳神経外科/ 2016年10月10日～22日)

I went to neurosurgery department and I learnt the latest technique, methods and knowledge of Interventional neuroradiology. In Tsukuba Medical Center Hospital, I learnt how to treat acute stroke patient by interventional neuroradiology using various kind of instruments of IVR. In University of Tsukuba Hospital, I learnt how to treat giant aneurysm by using flow diverter and brain arteriovenous malformation by using coiling. I could observed new equipment such as flow-diverting device, Pipeline™ Embolization Device, Marksman Micro Catheter; Navien Intracranial Support Catheter, Asahi Chikai Neurovascular Guide Wire.

I saw many instruments made in Japan. They are good quality so that the doctors can perform more precise and safe procedures of interventional neuroradiology. Because they are expertized skill and experiences, they also have a lot of instruments and experiences, they can get good results of the treatment of the patients with IVR.
