

Nguyen Van Tien Bao (チヨウライ病院 放射線科医 / 2017 年 11 月 19 日～12 月 2 日)

This is the first time I went to Japan. For the new interventional radiologist like me, it is a important chance to improve my knowledge.

I arrived Tsukuba in a beautiful autumn days, when the yellow, orange and red leaves on trees were fallen on the ground. It was amazing.

My room was near UTH, and it took 15 minutes to go to the hospital by bicycle. It was very convenient.

For 2 weeks, I had learn more and more important knowledge about IVR. I learned how to treat giant aneurysm by using flow diverter. There were some differences between Japan and my country. I asked professor Matsumaru and he explained me why they used coils first and after that, used pipeline. I think the medical insurance in Japan is really good. I had done some research about new equipments such as the flow-diverting device, navien intracranial support catheter, asahi chikai neurovascular guide wire

I saw Professor Matsumaru treated a spinal dural arteriovenous fistula. I think it was a difficult case. But the the professor embolize successful by Onyx. It was wonderful

I spent 3 interesting days in Tokyo. I learned so much there, about the knowledges in the meetings, about the Japanese culture, and about how to catch the train in Tokyo.

I also had and small party with the Japanese colleagues, they are very kindly.

I will remember those day I spend in Tsukuba. I hope to go there one more time.
