<心臓血管外科 受入・研修担当>

1. 平松 祐司 教授
2. 徳永 千穂 講師

This is my first time to Japan and UTH so I'm really happy and excited. Although the time was too short but I could visit both UTH and a conference in Kobe. I saw that UTH is a wonderful place to work and study; I could approach a modern and developed medicine here.

My day in UTH begins at 8 pm, I join to morning conference with everyone at Department of Cardiovascular Surgery. They discuss about the last operation cases and the new patients they would do in that day. They also prepared the protocol for every patient before the operation. There are about 1-2 operations case per day in DCS at UTH, the patient is prepared all the clinical and Para-clinical examinations one month before the operation, without staying in hospital. It is difference from my department at CRH because the patients in my department came from the province and they have severe disease so they must stay in hospital to wait for the operation. Thus we must prepare all things for them in one week before the operation. We have about 4 -5 cardiac operation cases per days in CRH.

After the conference, I went with Prof. Hiramatsu and all staff visited the patents operated in ICU and then went to the operation room. I found that all departments in UTH have full of modern equipment and link by grand network system. I could see all the information of patient in the computer and could follow the operation even when I stayed in ICU. It is an exciting and rewarding to learn. In CRH, we started to create a FPT network system too.

When I visited ICU in UTH, I found it is an open ICU where all the emergency cases include post operation cases stay here. In my department at CRH, we have an ICU just for post-operation cases and if the patient is stable we transfer them to the step-down zone after 24-48 hours. I saw that all the nurses and doctors here have worked hard and carefully. I found something difference from my department that the surgeon in UTH had to take care the patient from pre to post-operation, it is difficult for them to work all day in hospital. In my department, the ICU doctors will take care of the patients after the operation.

I was very lucky to have opportunity to participate a conference for thoracic surgery in Kobe where I could get much useful information for my career. They also displayed many of modern equipment and machines for cardiovascular surgery operation. On the way to Kobe I benefit some times to visit Golden Temple in Kyoto, one of the famous and amazing temples in Japan. During the time I was in Japan, the weather was great, the food was fresh and delicious, all people in OPIMA office and Department of Cardiovascular Surgery was very friendly and kindness. I would like to appreciate to Prof. Akiyama and Prof. Hiramatsu who always pay attention and take care of us. I had

really enjoyed my time in Japan. I wish I could have other chances to visit and study in your country. Once again, thank you for everything.
